

# Machine Learning

## Chapter 1: Introduction

Fall 2023

Instructor: Xiaodong Gu

# Today

## History

**Why study machine learning?**

**What is machine learning?**

- ▷ Key elements

**How machine learning works?**

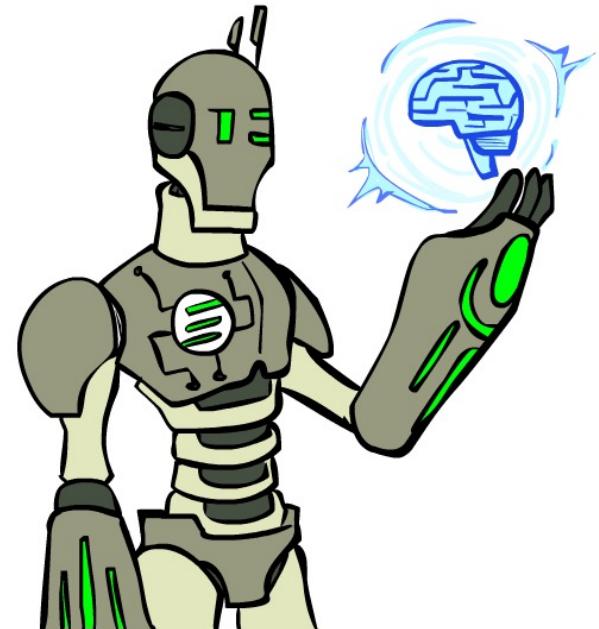

- ▷ A generic pipeline
- ▷ A working example

**Overview of machine learning algorithms**

- ▷ Categories
- ▷ Typical algorithms

**Important ML concepts that we'll use throughout the semester**

- ▷ Generalization、overfitting、regularization

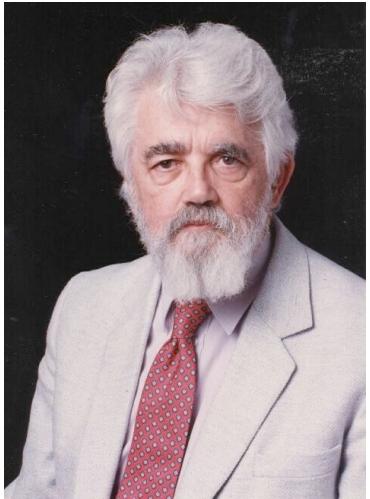

# What is Artificial Intelligence (AI) ?

## What is intelligence ?

- Capacity for logic, understanding, self-awareness, learning, reasoning, planning, creativity, critical thinking, and problem-solving.

**John McCarthy**  
one of the founders of the  
discipline of AI

## What is artificial intelligence ?

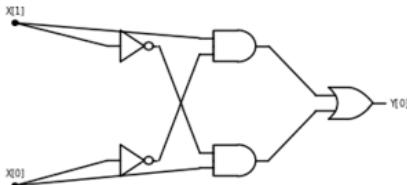

- It is the science and engineering of **making intelligent machines**, especially intelligent computer programs.

# A Brief History of AI

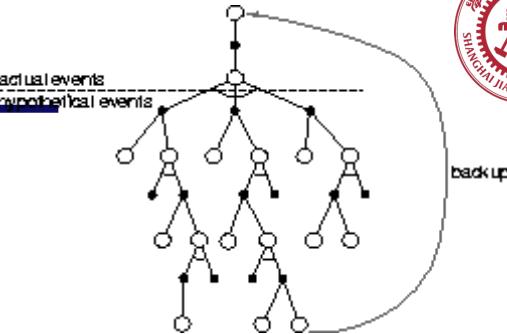

## 1940–1950s: Early days

- 1943: McCulloch & Pitts: **Boolean circuit** model of brain
- 1950: Turing's "Computing Machinery and Intelligence"

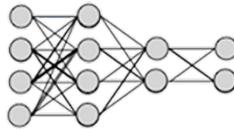

## 1950–1960s: Excitement: Look, Ma, no hands!

- 1950s: Early AI **programs**, including Samuel's checkers program, Newell & Simon's **Logic Theorist**, Gelernter's Geometry Engine
- 1956: Dartmouth meeting: "Artificial Intelligence" adopted

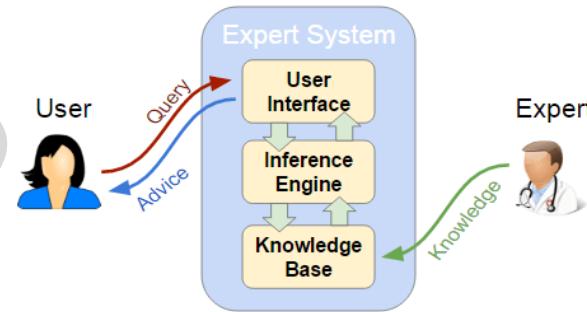

## 1970–80s: Knowledge-based approaches

- 1969–79: Early development of **knowledge-based systems**
- 1980–88: Expert systems industry booms
- 1988–93: Expert systems industry busts: "AI Winter"

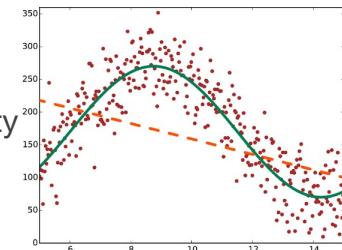

## 2012–: Deep learning

- 2012: ImageNet & AlexNet
- **Deep Neural Networks**

## 1990–: Statistical approaches

- **Data**-driven machine learning algorithms
- Resurgence of **probability**, focus on uncertainty
- General increase in technical depth
- Agents and learning systems... "AI Spring"?

# Artificial Intelligence vs. Machine Learning

---

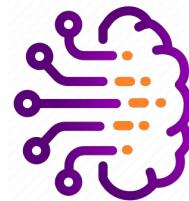

## Artificial Intelligence

Computer systems that perform tasks that would usually require human intelligence

## Machine Learning

Statistical techniques that learn from a series of inputs and outputs

## Deep Learning

Machine learning algorithms that enable self learning of data representations

# History of Machine Learning

## 1950-1960s

### Logical Inference

The creation of “Machine Learning”  
Turing test  
Neural networks

## 1980-1990s

### Inductive and Statistical Learning

Learning from examples  
BP Neural Networks  
Statistical Learning

## 1970-1980s

### Knowledge Based Learning

Assign human knowledge to computer systems

## 2012-

### Deep Learning

Deep Neural Networks  
AlphaGo

---

# Why Machine Learning?

# Traditional Programming vs Machine Learning

## Traditional Programming

Write a computer program with  
**explicit instructions** to follow

```
if email contains "发票"  
  then mark is-spam;  
if email contains ...  
if email contains ...
```

So many decision rules...

## Machine Learning

Write a computer program to  
automatically **learn from examples**

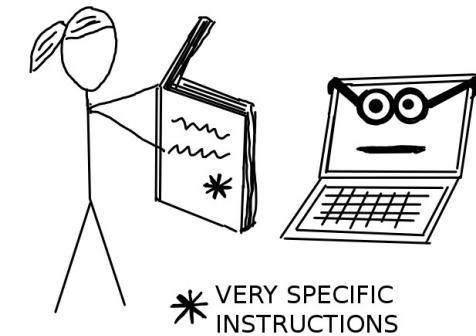

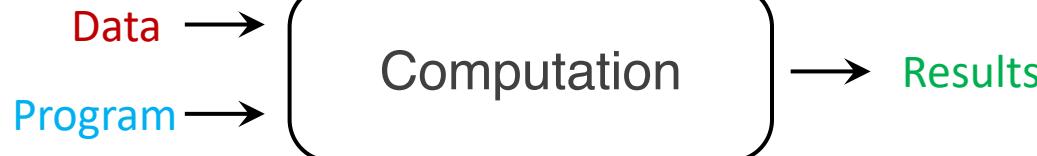

Magic!

Machine Learning = “**The ability to learn without being programmed**”

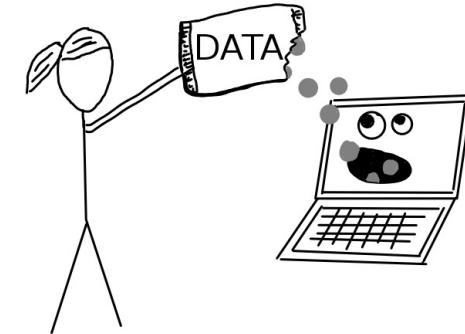

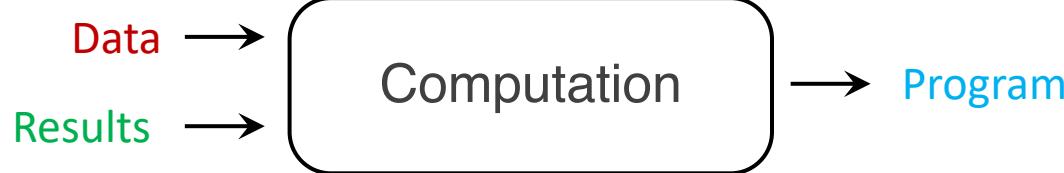

# Traditional Programming vs Machine Learning

## Traditional Programming

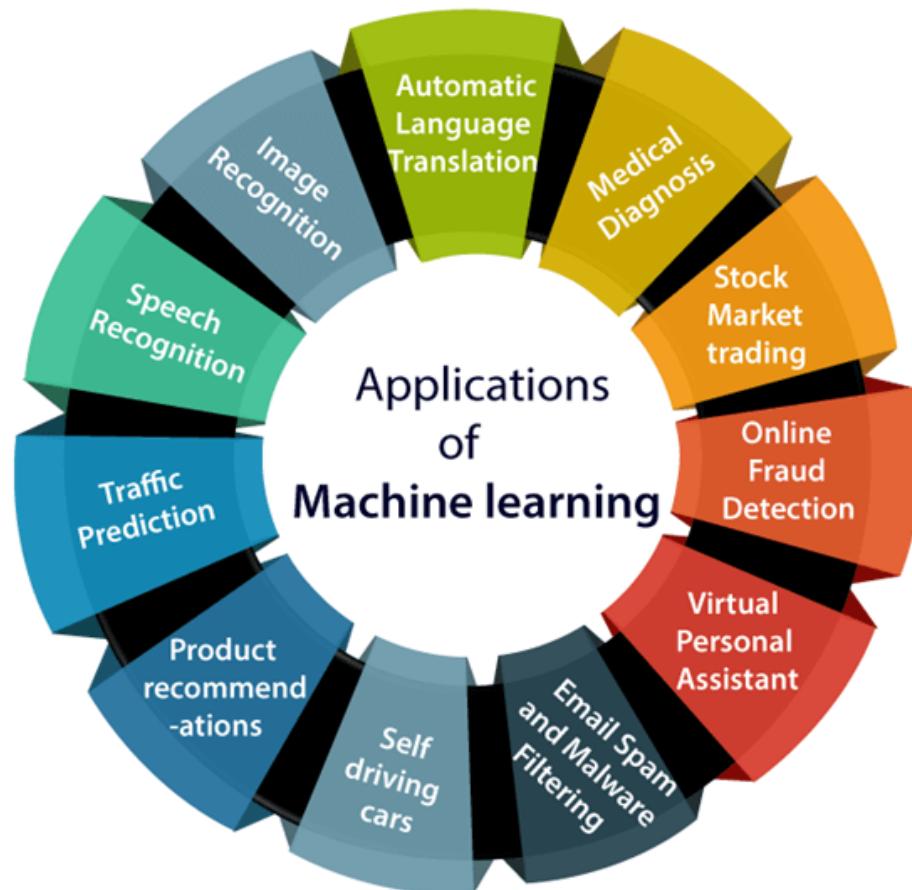

## Machine Learning

# Machine Learning Applications

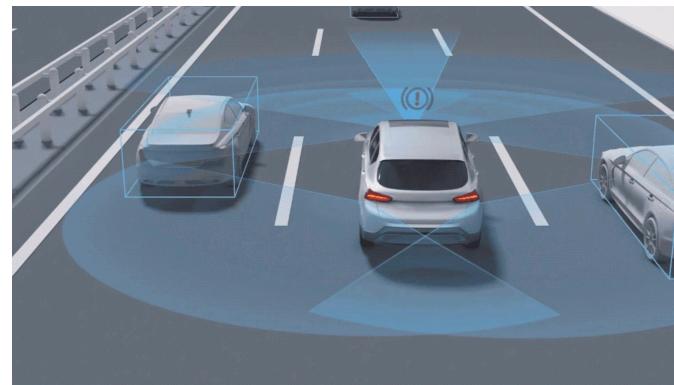

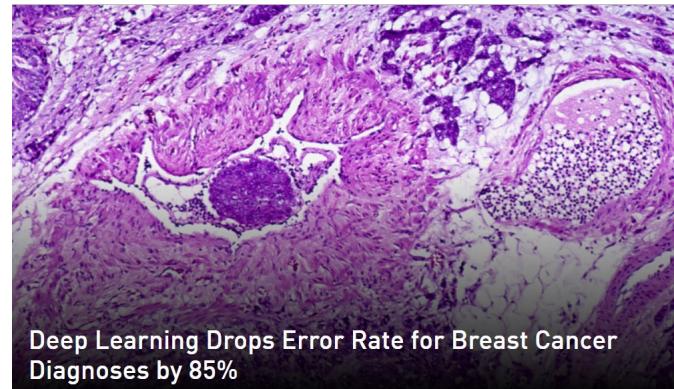

Machine learning is very widely used in:

# Machine Learning Applications

**Computer Vision:** object detection, semantic segmentation, diagnoses, self-driving, etc.

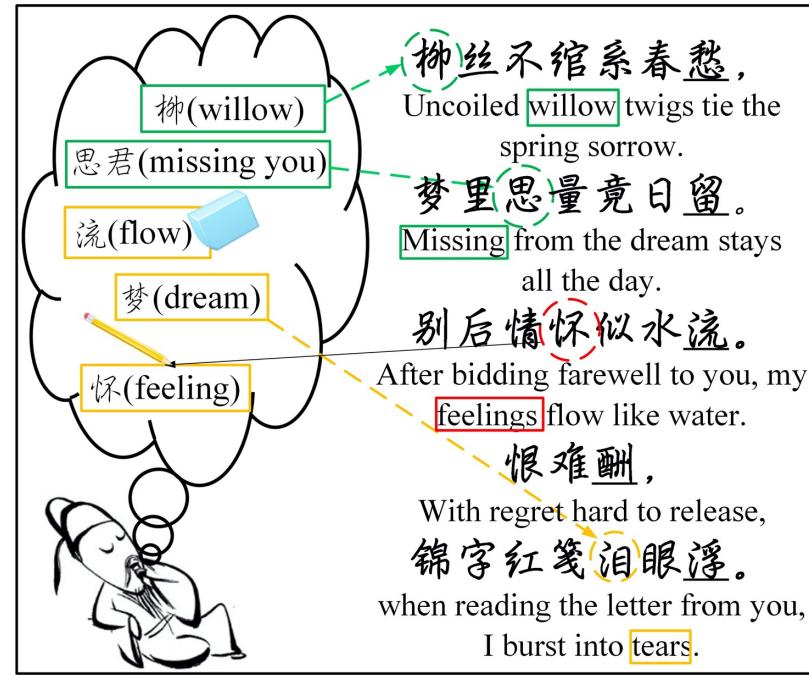

# Machine Learning Applications

NLP: translation, QA, summary, article, etc.

The screenshot shows the Google Translate interface. The top bar includes the Google logo, a menu icon, and a login button. Below the bar are tabs for "文字" (Text) and "网站" (Website). The source language is set to "检测到中文 (简体)" (Detected Chinese (Simplified)) and the target language is "英语" (English). The main content area displays a paragraph in Chinese and its English translation. The Chinese text discusses the launch of Google's neural machine translation system, highlighting its ability to translate complete sentences while maintaining accuracy. The English translation provides a summary of this information.

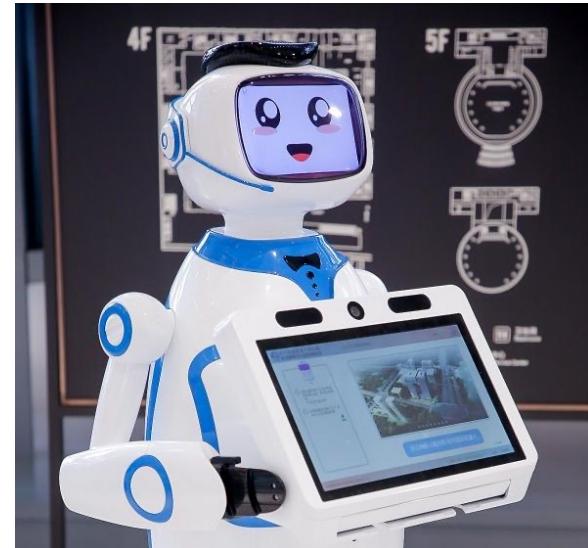

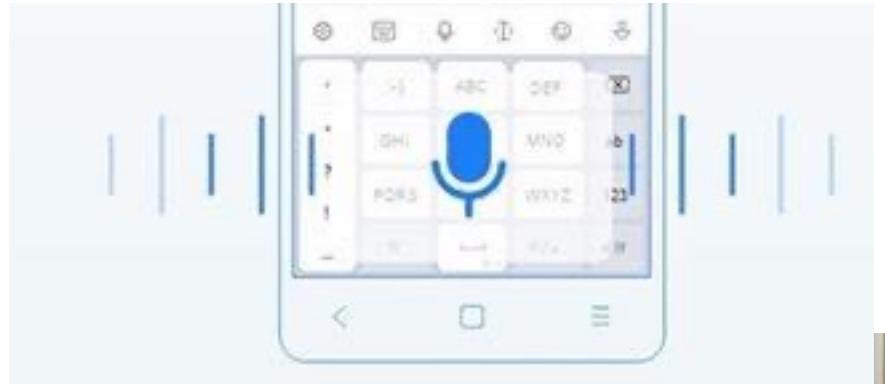

Chinese poem generation. Can you distinguish?

Yi et al. Chinese Poetry Generation with a Working Memory Model. IJCAI'18

# Machine Learning Applications

## User Profiling

# Machine Learning Applications

## AI Programmer

The screenshot shows a code editor interface with a tab bar at the top containing five files: fetch\_tweets.js, fetch\_tweets.py, fetch\_tweets.rb, fetch\_tweets.ts, and fetch\_tweets.go. The fetch\_tweets.js file is currently selected and displayed in the main editor area. The code implements an asynchronous function to fetch tweets from a user's timeline using the Twitter API. It uses the `process.env` object to get the Bearer token and the `fetch` function to make a GET request to the Twitter API endpoint. The response is then converted to JSON. The code is annotated with line numbers from 1 to 14.

```
1 const token = process.env["TWITTER_BEARER_TOKEN"]
2
3 const fetchTweetsFromUser = async (screenName, count) => {
4   const response = await fetch(
5     `https://api.twitter.com/1.1/statuses/user_timeline.json?screen_name=${screenName}&count=${count}`,
6     {
7       headers: {
8         Authorization: `Bearer ${token}`,
9       },
10    }
11  )
12  const json = await response.json()
13  return json
14}
```

# A Simple Analogy

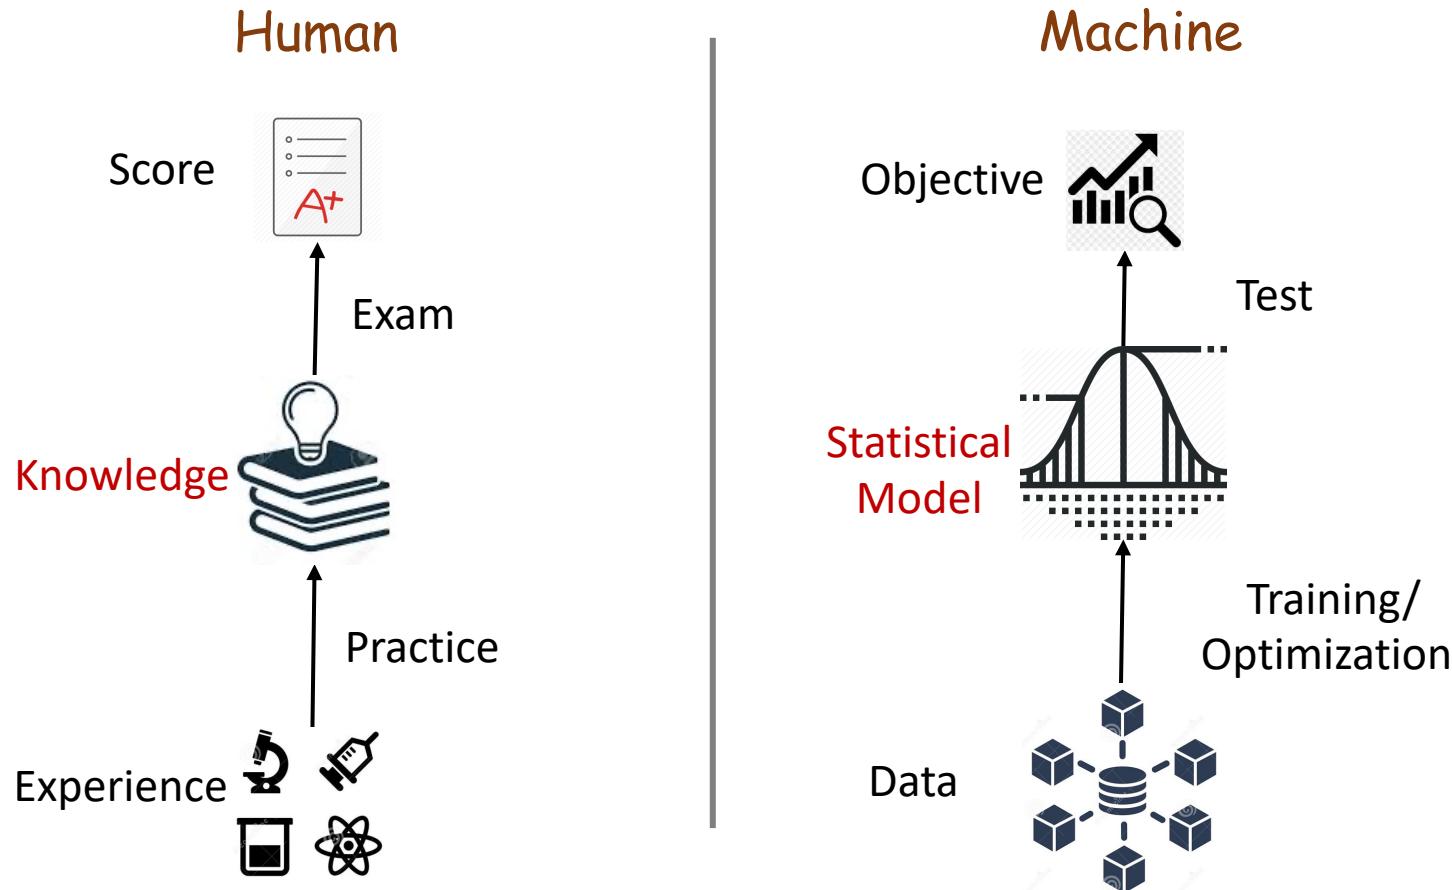

## Human Learning vs. Machine Learning

# A Simple Analogy

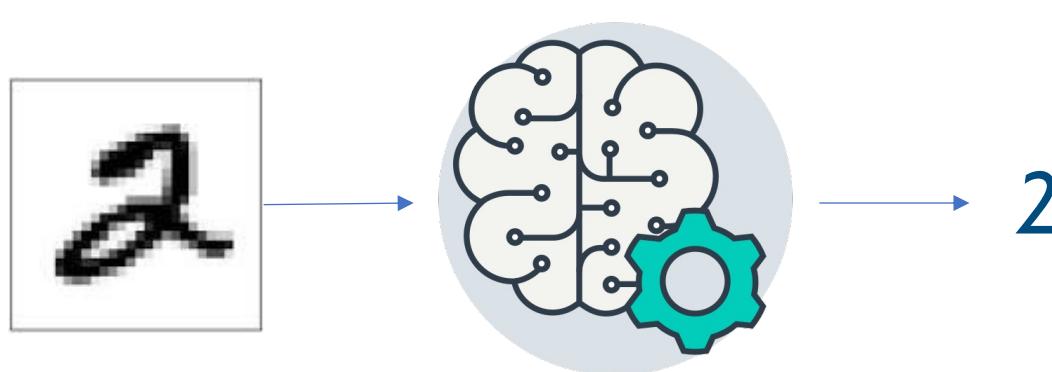

## Human Learning vs. Machine Learning

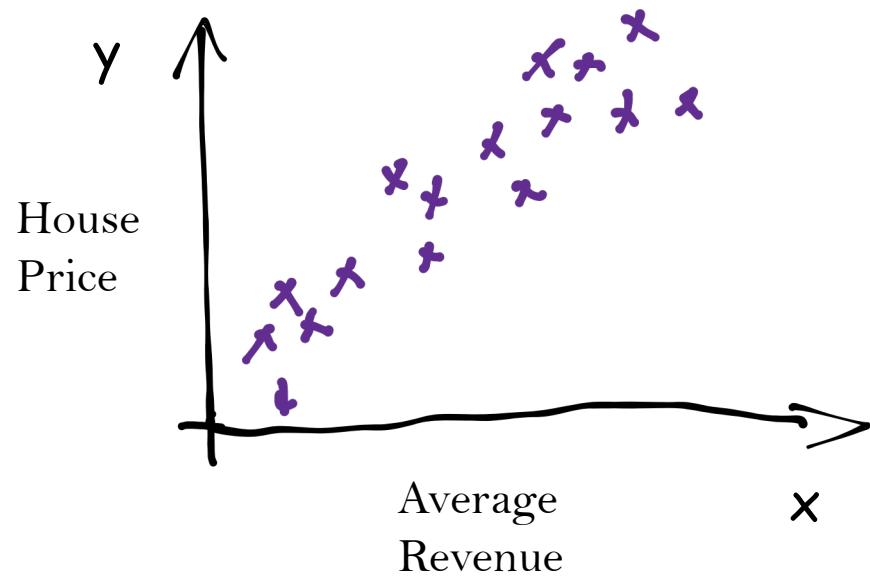

# So, what exactly is machine learning?

A subset of artificial intelligence which uses **statistical methods** to enable machine to **improve** towards an **objective** using **data** without requiring explicit programming by human.

# Key Elements of Machine Learning

**Elements:**

**#1 Data (Experience)**

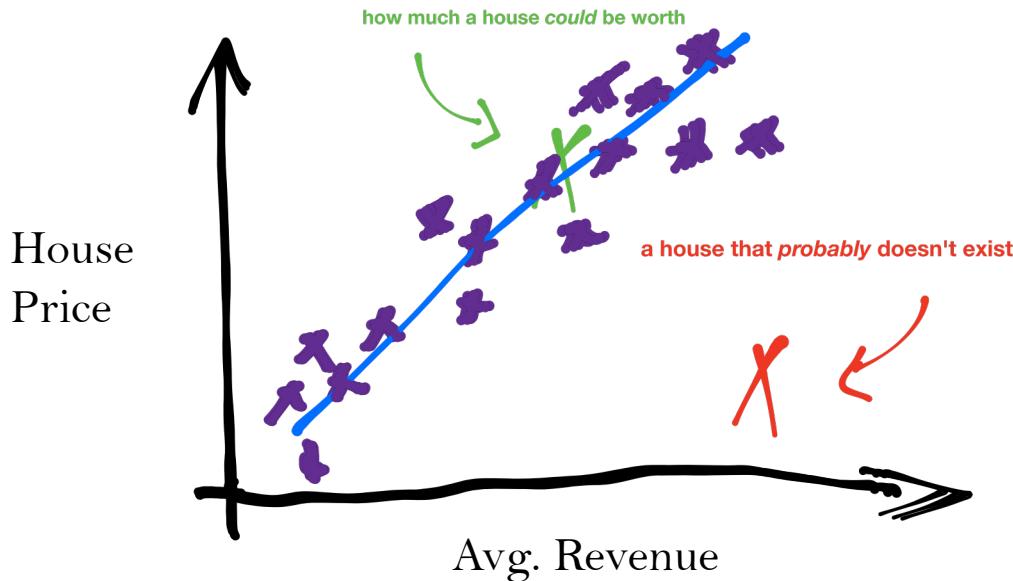

$$D = \{(x^{(1)}, y^{(1)}), (x^{(2)}, y^{(2)}), \dots, (x^{(N)}, y^{(N)})\}$$

# Key Elements of Machine Learning

We **cannot** learn from data

We **can** learn from data + *hypothesis*

What hypothesis do we make about this data?

## Elements:

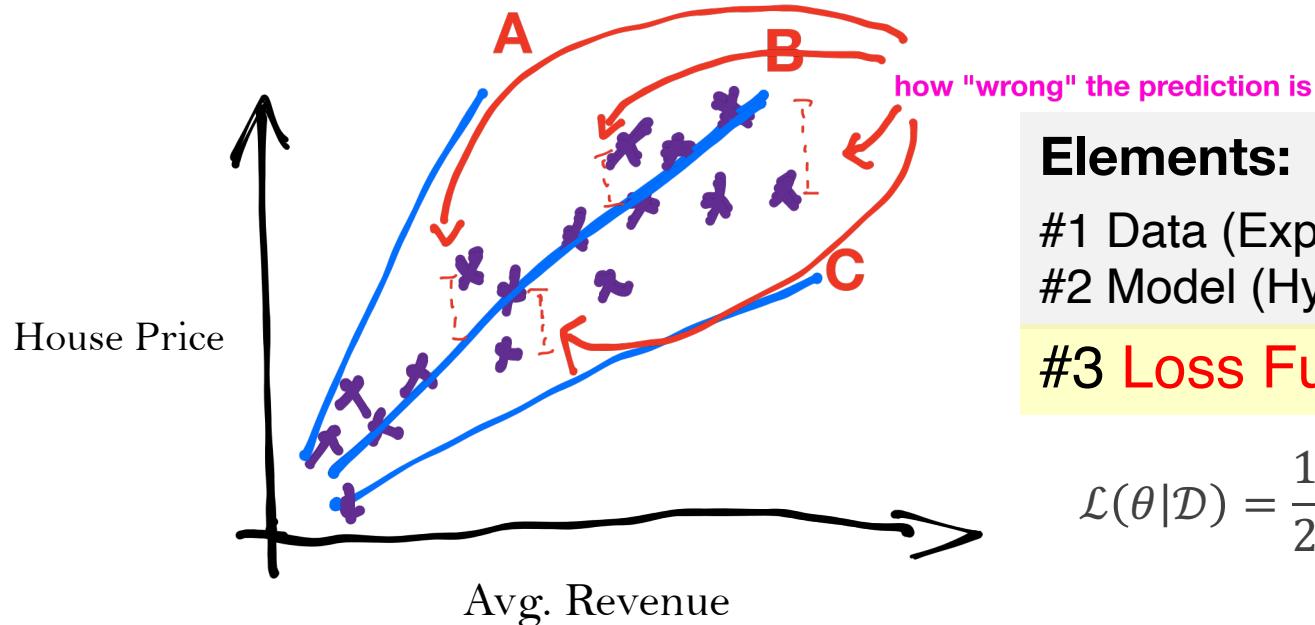

#1 Data (Experience)

**#2 Model(Hypothesis)**

$$\hat{y} = g(x|\theta) + \epsilon$$

e.g.  $\hat{y} = wx + b$   
where  $\theta$  (e.g., W and b)  
denotes the parameters

# Key Elements of Machine Learning

## Elements:

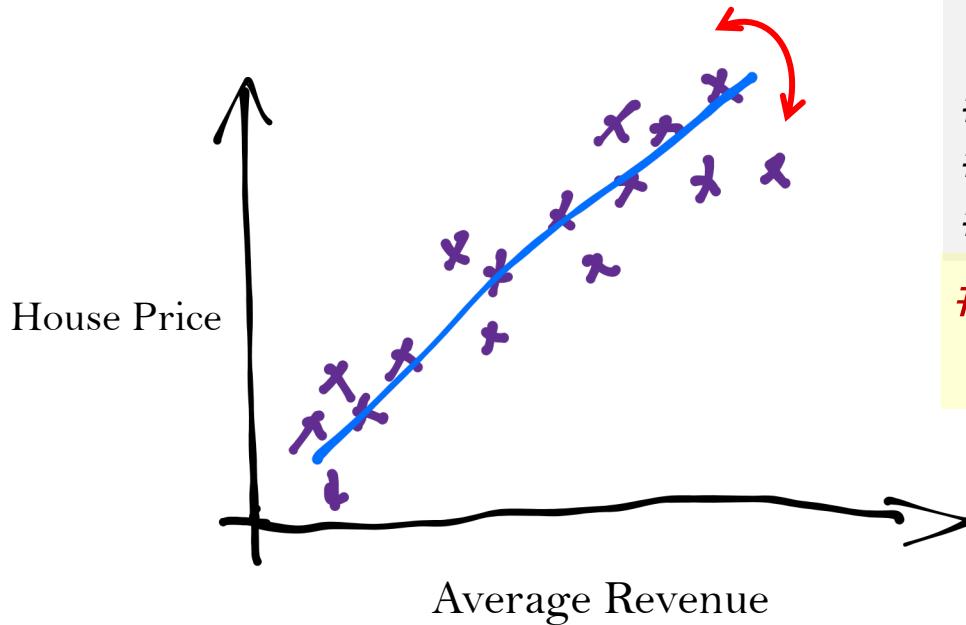

- #1 Data (Experience)
- #2 Model (Hypothesis)

## #3 Loss Function (Objective)

$$\mathcal{L}(\theta | \mathcal{D}) = \frac{1}{2} \sum_{n=1}^N [w x_n + b - y_n]^2$$

How to evaluate a model? (performance criterion)

# Key Elements of Machine Learning

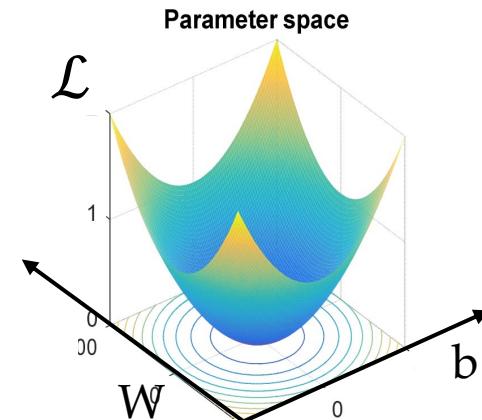

How to find the optimal model?

## Elements:

- #1 Data (Experience)
- #2 Model (Hypothesis)
- #3 Loss Function (Objective)

**#4 Optimization Algorithm**  
(Improvement)

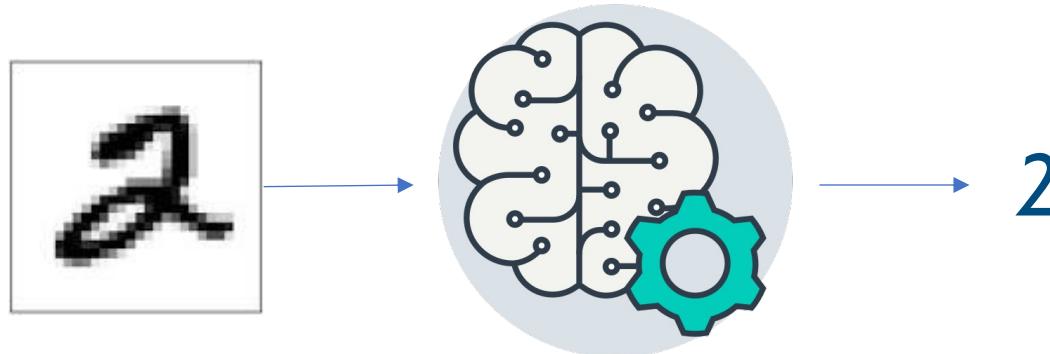

$$\theta^* = \underset{\theta}{\operatorname{argmin}} \mathcal{L}(\theta | \mathcal{D})$$

# So, what exactly is machine learning ?

A subset of artificial intelligence which uses statistical methods (**model**) to enable machine to improve (**optimization**) towards an objective (**loss function**) using (**data**) without requiring explicit programming by human.

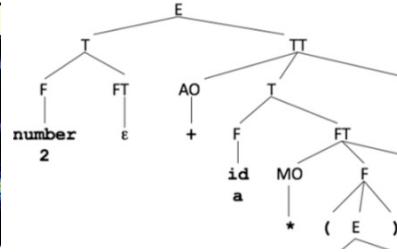

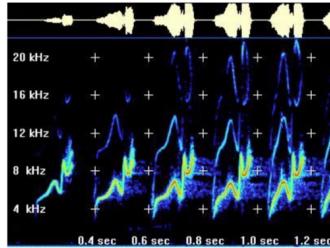

# Generalized to other data

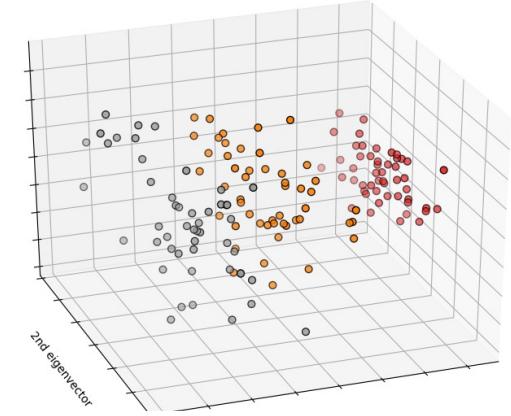

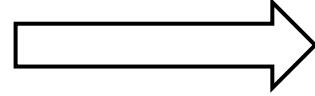

What about other data structures?

**Chairman of the Board & Chief Executive Officer**  
Chairman of the board and chief executive officer joint in 1994 and a director of ADIC since 1986. In October 1996, Mr. van Oppen served as Chairman and chief executive officer of Interpoint. Prior to 1985, Mr. van Oppen was a managing partner at Price Waterhouse LLP and at Bain. He has additional experience in medical electronics and serves as a director of Seattle Pinworks Inc. and L. K. from Whitman College and an M.B.A. from Harvard. He was a Baker Scholar.

# Quiz

---

以下人类学习行为分别对应哪种机器学习要素？

1. 查文献
2. 考试
3. 错题总结
4. 挂科

---

Hello, World

# How machine learning works?

“Hello-World” for machine learning

# Recall: Key Elements of Machine Learning

---

- **Data** (Experience)
- **Model** (Hypothesis)
- **Loss Function** (Objective)
- **Optimization Algorithm** (Improve)

# How to Approach a Machine Learning Problem?

- ① consider the nature of available **data D**
  - how much amount of data can you obtain? how would it cost (in time, computation, human efforts)?
- ② select a **representation** for the input **X**
  - data preprocessing, feature extraction, etc.
- ③ choose a set of possible **models H** (hypothesis space)
  - set of functions  $h: X \rightarrow Y$
- ④ choose the **performance measure P** (loss function)
- ⑤ choose or design a learning **algorithm**
  - for using examples (**E**) to converge on a member of **H** that optimizes **P**

# A Working Example

## Task: Automatic Fruit Classification

Data

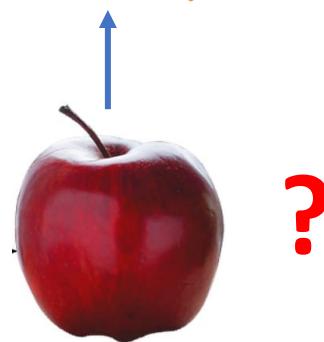

Model

Prediction

What  
is it?

# Data Collection

## Create training samples

- Tell me which type a specific fruit belongs to

Sample	Label
	Apple
	Orange
	Apple
...	...

# Pre-processing

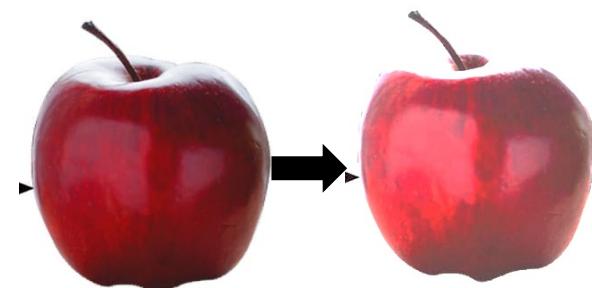

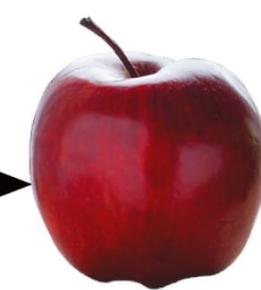

Different types of fruit differ in size, lightness, position, etc.

Needs pre-processing!

Example:

remove the background

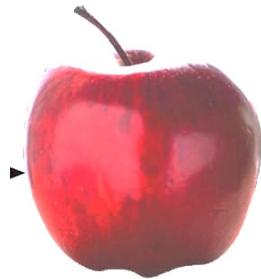

adjust for light level

# Feature Extraction

Consider each fruit as a **point** in some **feature space**

## Feature:

Color: red  
Shape: round  
Size: 3  
...

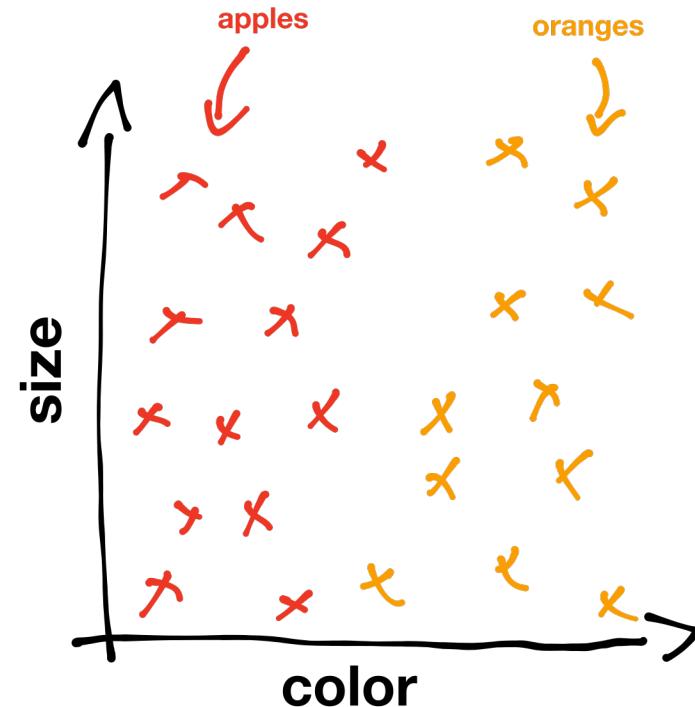

$$\begin{bmatrix} 1 \\ 0 \\ 3 \end{bmatrix}$$

## Feature:

Color: orange  
Shape: round  
Size: 2  
...

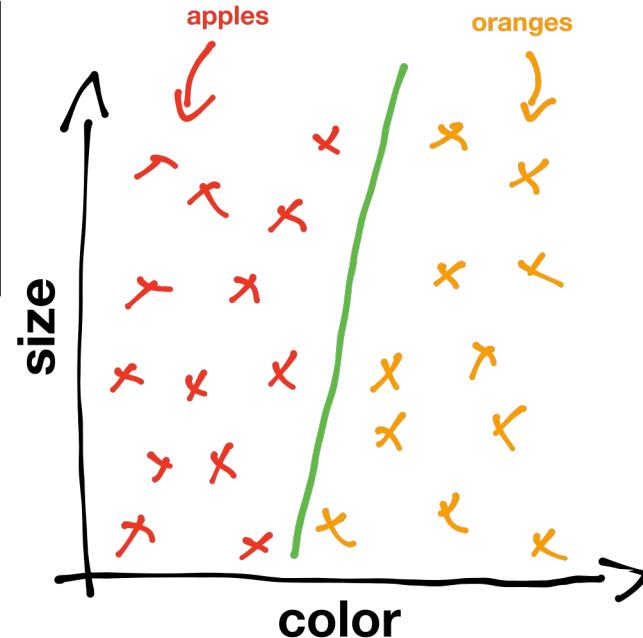

$$\begin{bmatrix} 2 \\ 0 \\ 2 \end{bmatrix}$$

# Learning (Training)

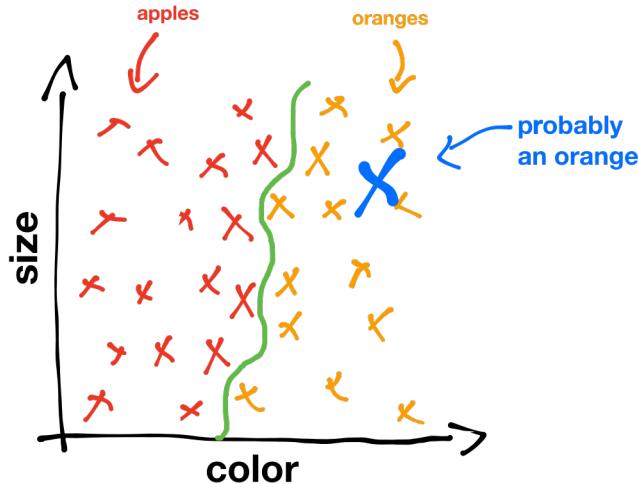

Partition the feature space into 2 regions, one for each type of fruit

- decision boundary

# Test and Evaluation

## How to handle new images?

**Classifying** a new image  
using the trained classifier .

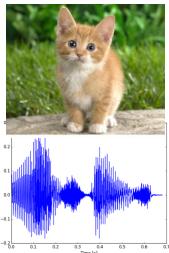

How to measure the classifier performance?

- classification error rate
  - % patterns that are assigned to the wrong category
- other aspects may be important too
  - e.g. computational complexity
  - e.g. user-friendliness

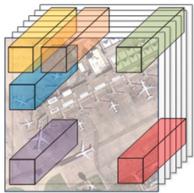

# Pipeline of an ML System

## Data Collection

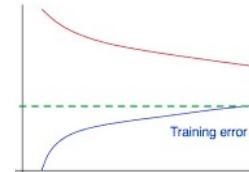

## Feature Extraction

## Training

## Train model

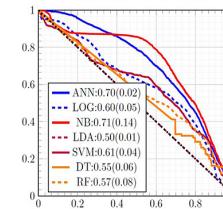

## Validation

## Evaluation

## Prediction

## Evaluation

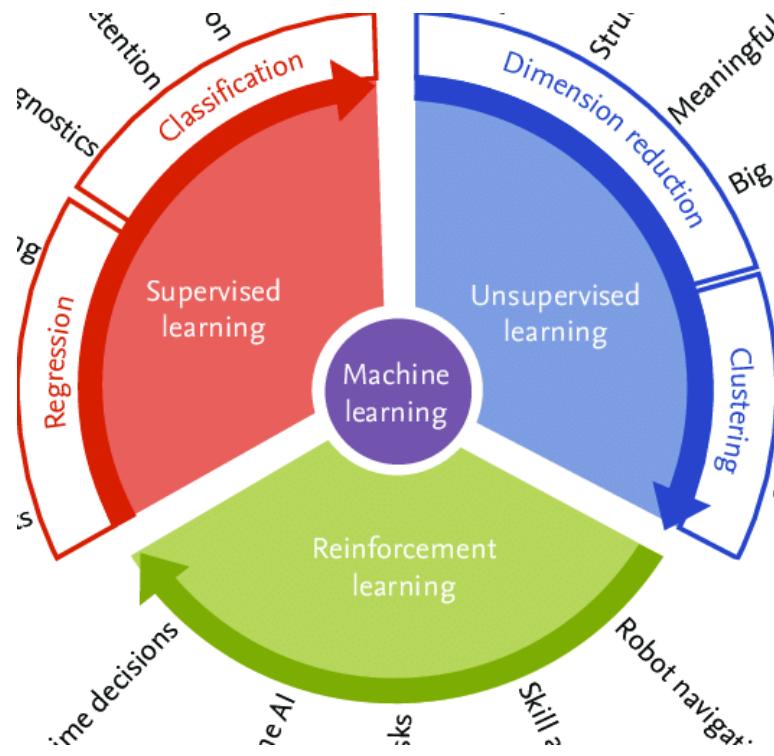

---

# Overview of Machine Learning Algorithms

# Categories of Machine Learning Algorithms

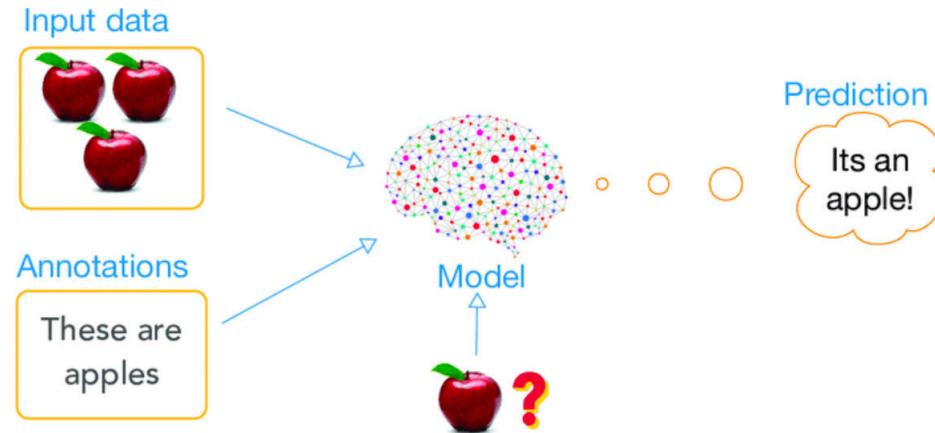

- Supervised Learning
- Unsupervised Learning
- Reinforcement Learning

# Supervised Learning

- The learner is provided with a set of **inputs** together with the corresponding desired **outputs**.

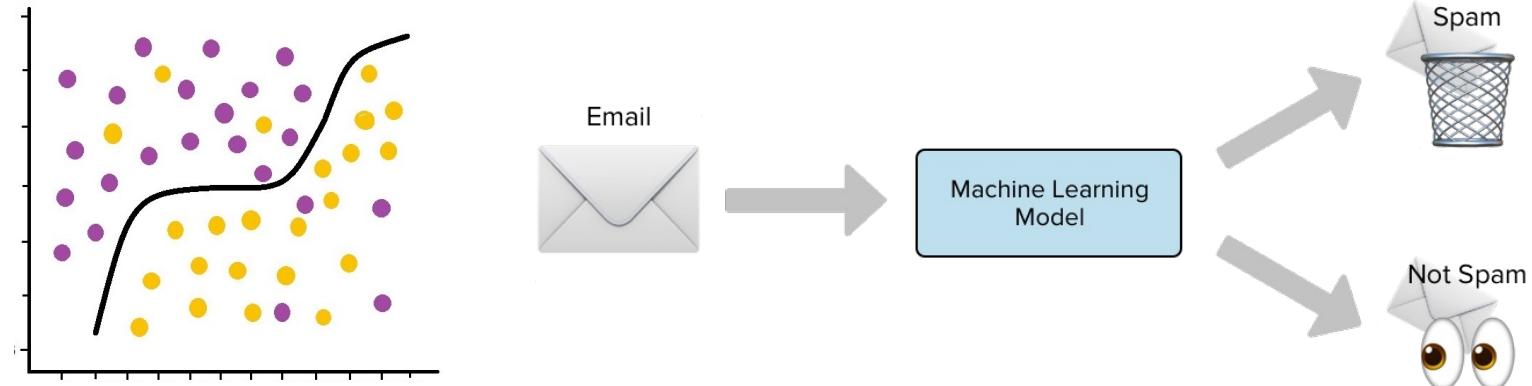

- has a “teacher”

## Example

- teaching kids to recognize different animals.
- graded examinations with correct answers provided.

# Supervised Learning

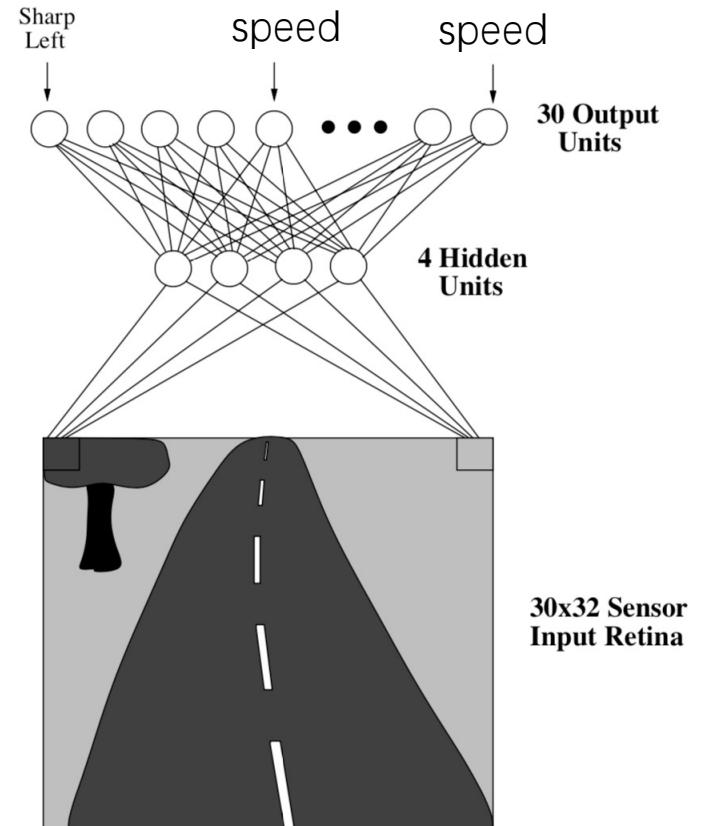

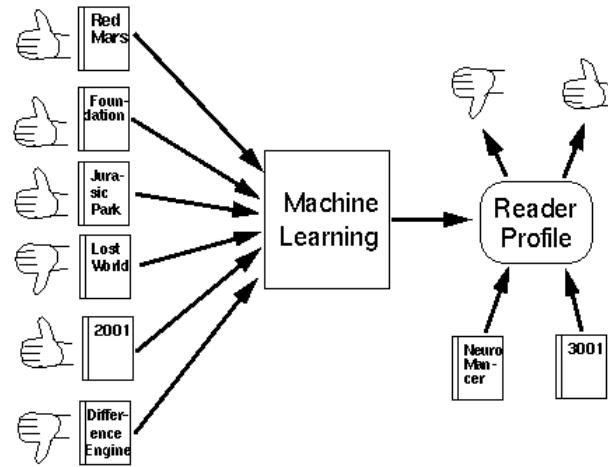

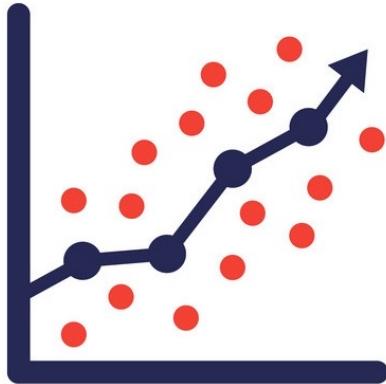

## Classification

# Supervised Learning

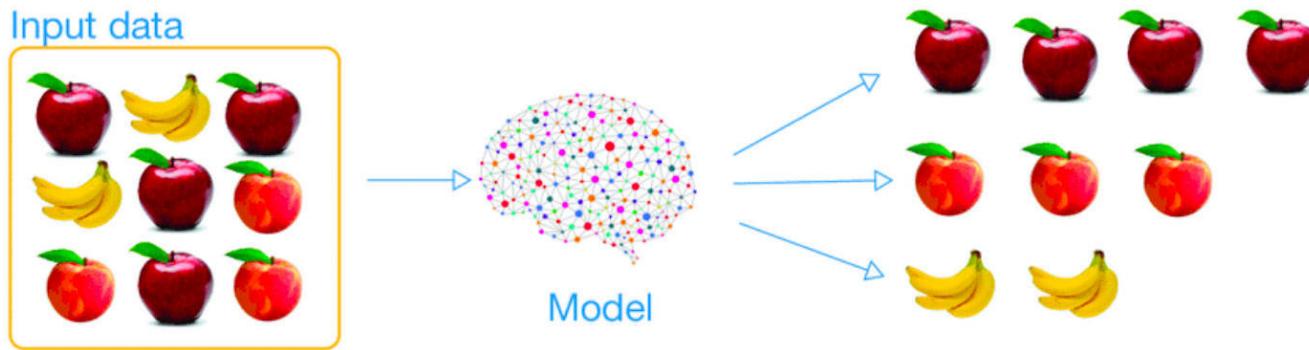

## Regression

# Unsupervised Learning

Training examples as **input** patterns, with **no** associated output.

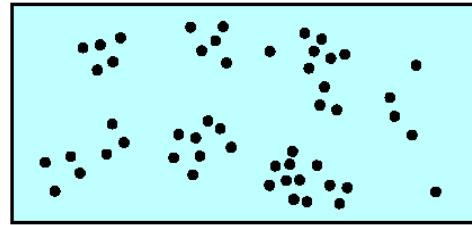

- no teacher
- similarity measure exists to detect groupings / clusterings

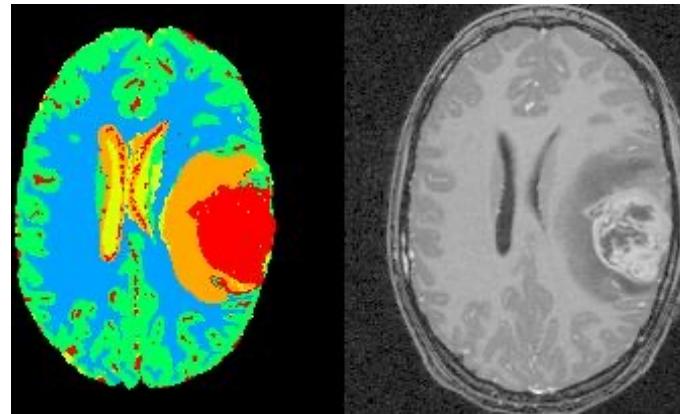

# Unsupervised Learning

## Clustering

- in the early stages of an investigation, it may be helpful to perform **exploratory data analysis** to gain some insight into the nature or structure of the data.

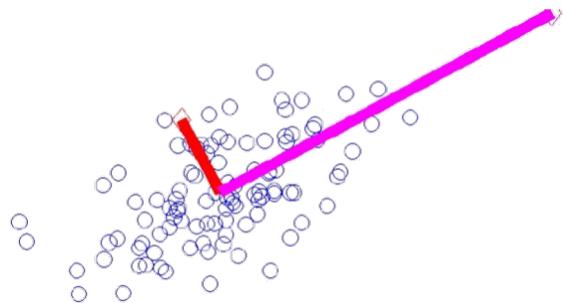

# Unsupervised Learning

## Dimensionality Reduction and Feature Selection

- find **features** or preprocess existing features for the subsequent pattern classification problem (supervised learning)

Principal component analysis (PCA)

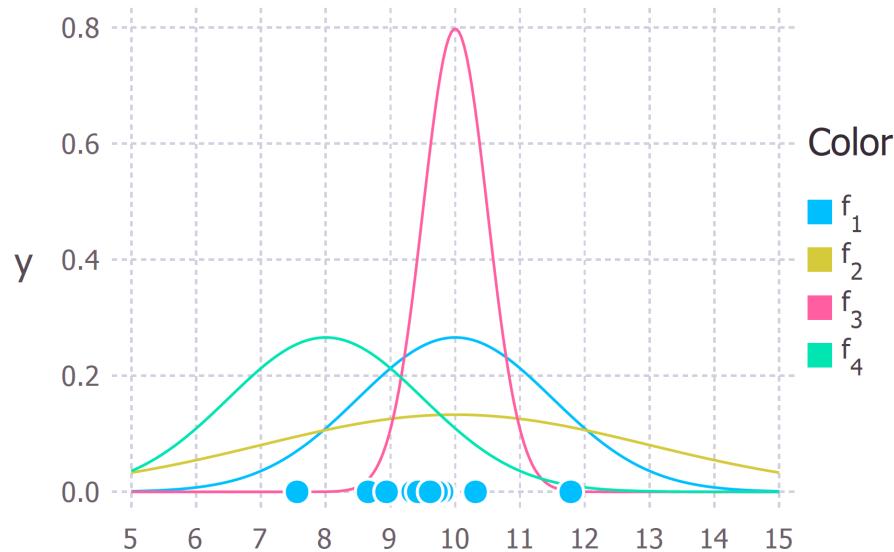

Example (eigenface)

# Unsupervised Learning

## Probability Estimation

### Applications

- Density estimation
- Data generation
- Abnormal Detection

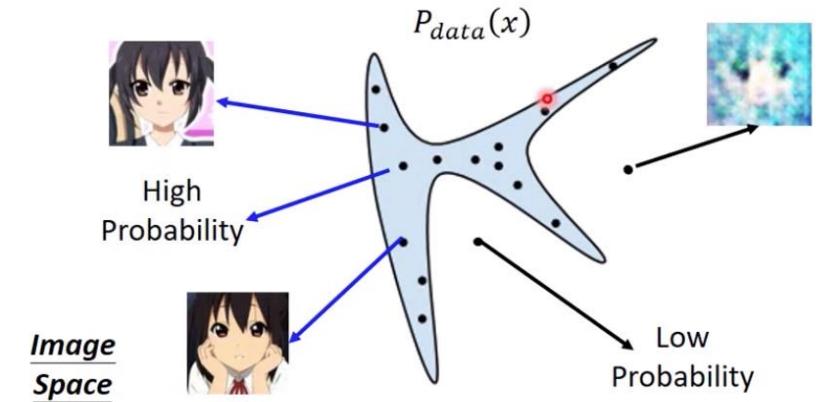

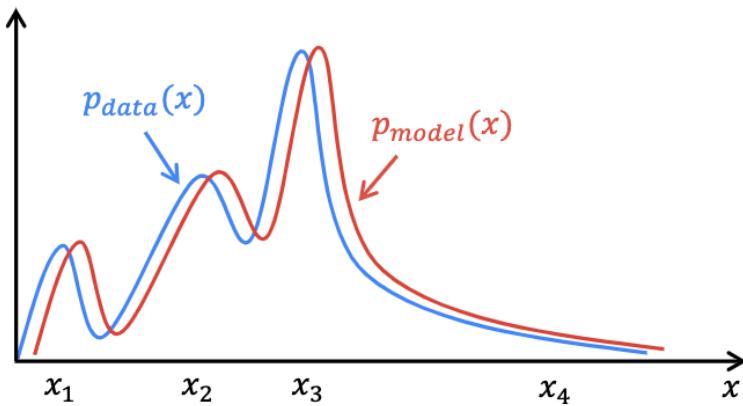

# Unsupervised Learning

## Data Generation

The goal of the generative model is to find a  $p_{model}(x)$  that approximates  $p_{data}(x)$  well.

Distribution of images generated by the model

Distribution of actual images

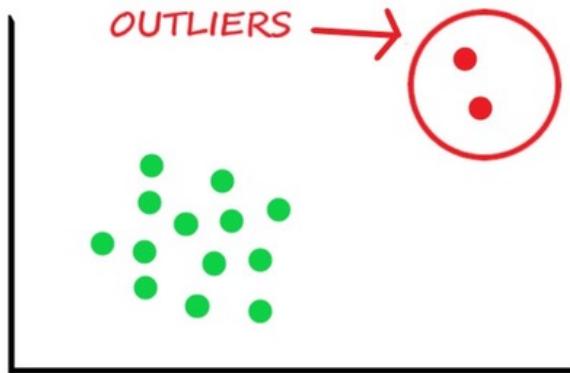

# Unsupervised Learning

**Outlier Detection** – find the least likely observations from a dataset.

Example: network intrusion detection

NETWORK SECURITY FUNCTION	INGRESS	EGRESS	EAST-WEST
Web Application Firewall (WAF)	✓	-	**
Intrusion Detection/Prevention (IDS/IPS)	✓	✓	✓
AntiVirus Detection/Blocking	✓	✓	**
URL/FQDN Filtering (includes Explicit and Category based profiles)	-	✓	✓
Data Loss Prevention (DLP)	-	✓	✓
Layer7 DoS	✓	-	✓
Malicious IP Blocking	✓	✓	-
GeoIP Blocking	✓	-	**
Threat Packet Captures	✓	✓	✓

# Supervised vs. Unsupervised Learning

## Supervised Learning

**Data:**  $(x, y)$   
 $x$  is data,  $y$  is label

**Goal:** Learn function to map  
 $x \rightarrow y$

**Examples:** Classification,  
regression, object detection,  
semantic segmentation, etc.

## Unsupervised Learning

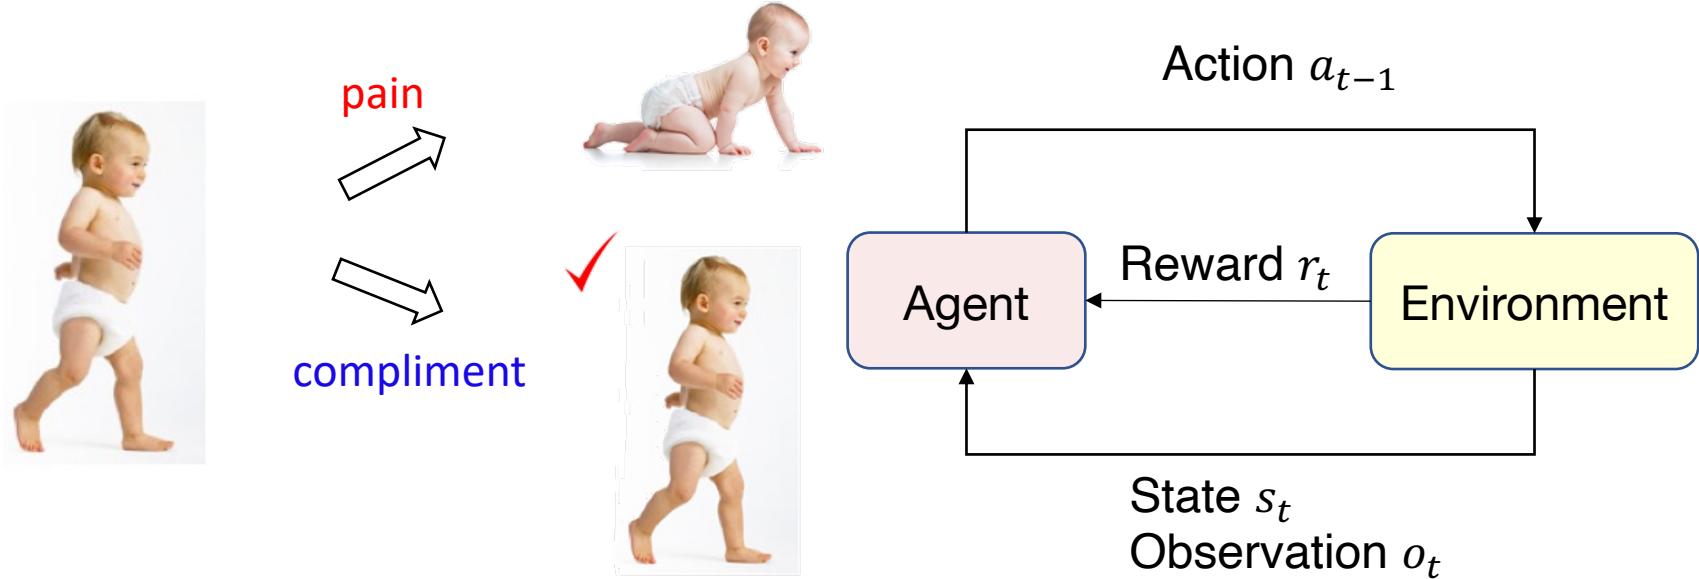

**Data:**  $x$   
 $x$  is data, no label

**Goal:** Learn the hidden or  
underlying structure of the data.

**Examples:** Clustering,  
dimensionality reduction,  
probability estimation, etc.

# Reinforcement Learning

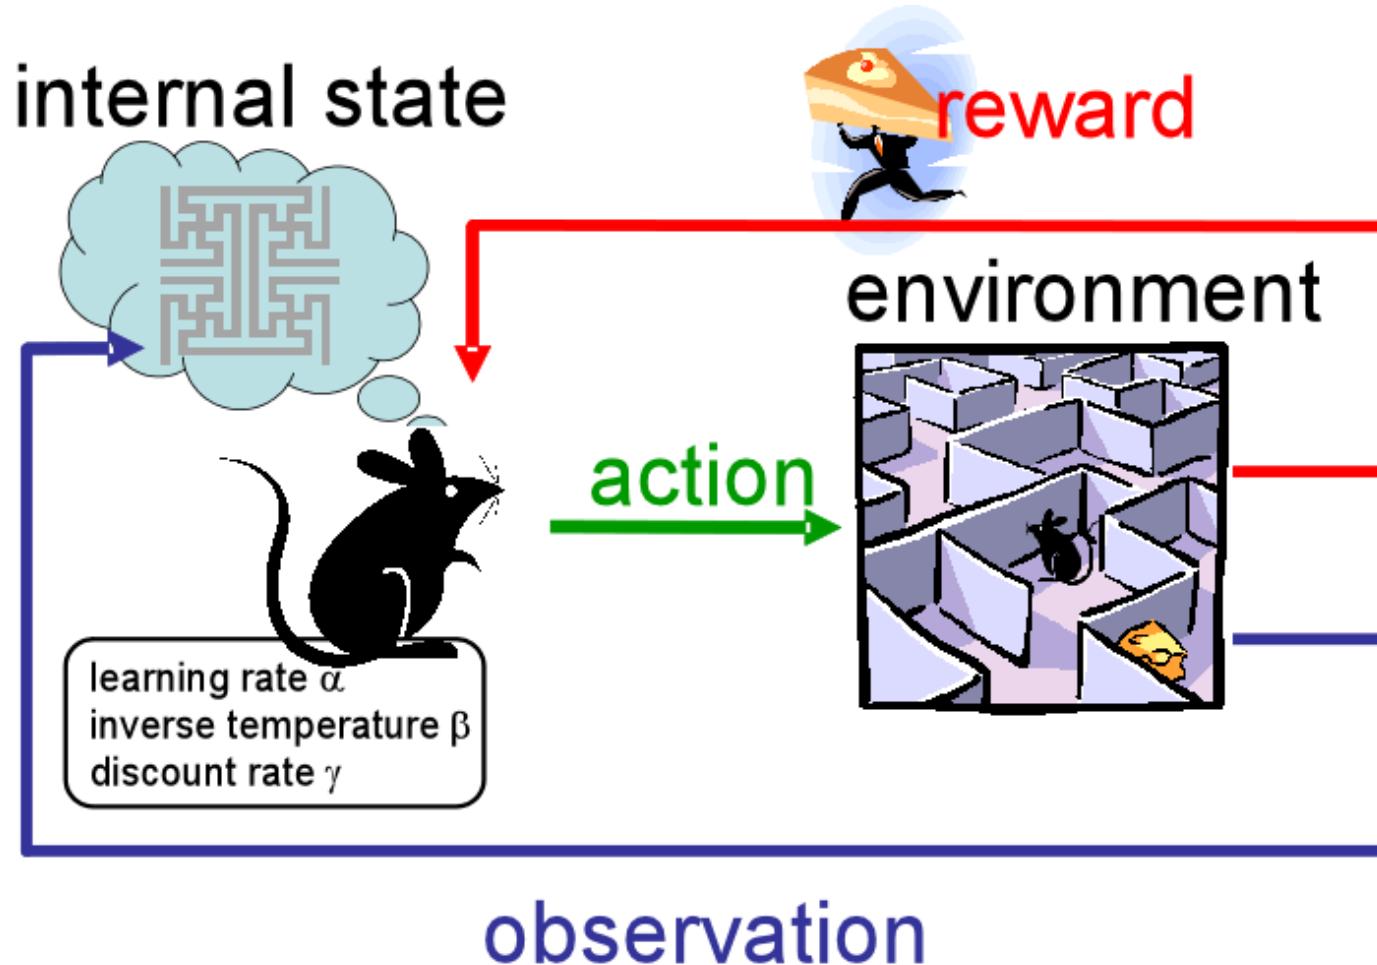

- Learning from **interacting** with an **environment**.

Learning a mapping from **states** to **actions** to maximize long-term **reward**.

Example: graded examinations with only overall scores but no correct answers

# Example

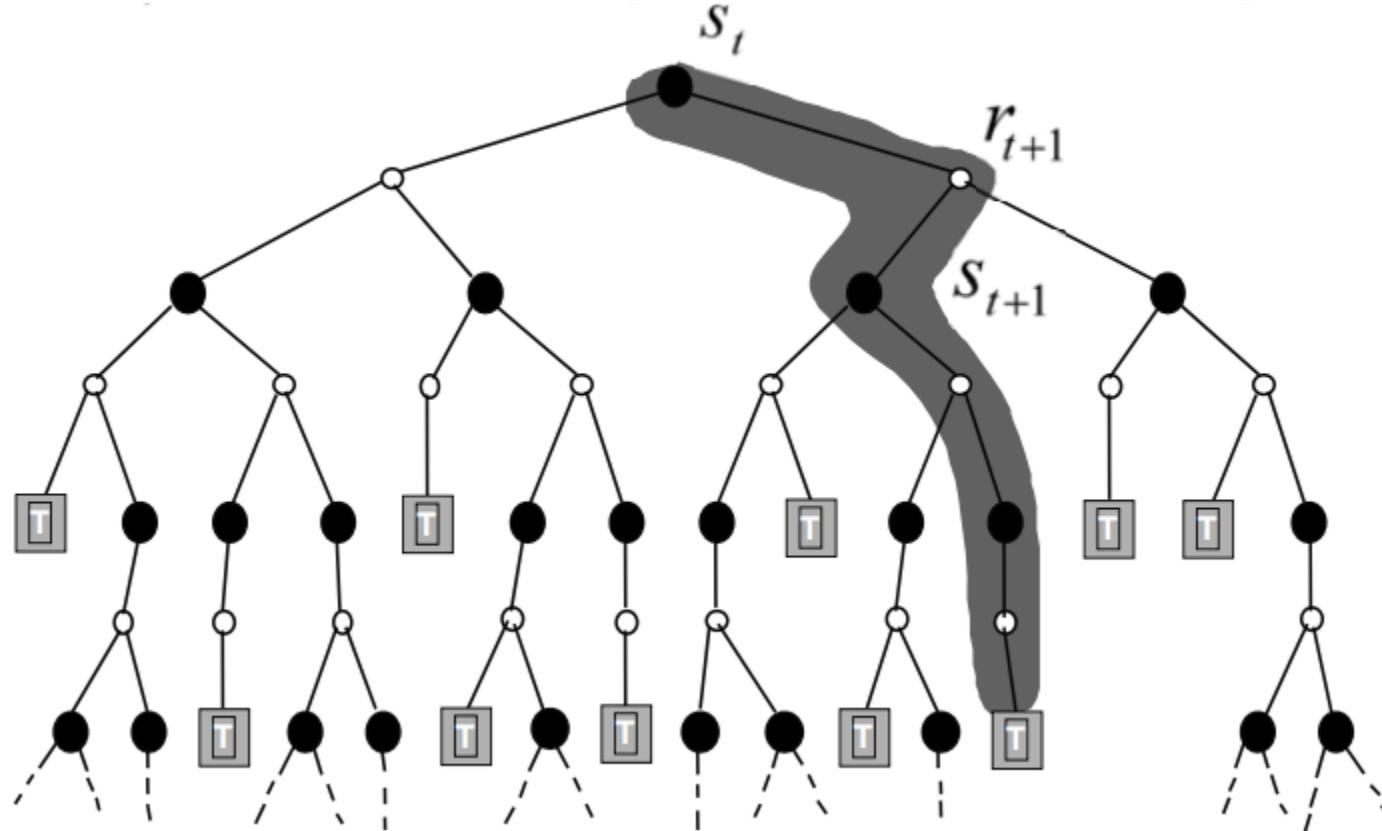

# Monte-Carlo Reinforcement Learning

$$v(s_t) \leftarrow v(s_t) + \alpha[R_t - v(s_t)]$$

$R_t$  is the actual long-term return following state  $s_t$  in a sampled trajectory

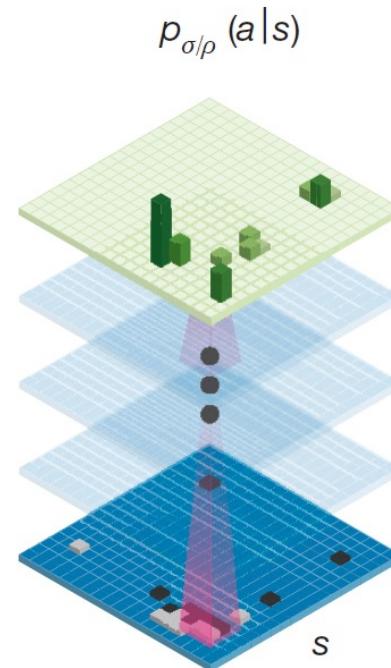

# Reinforcement Learning

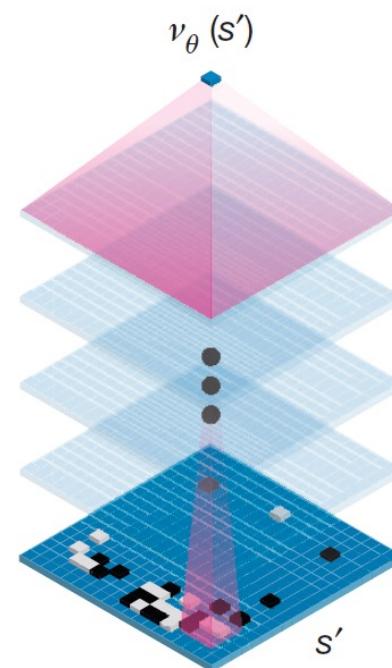

## Example: AlphaGo

Policy network

Value network

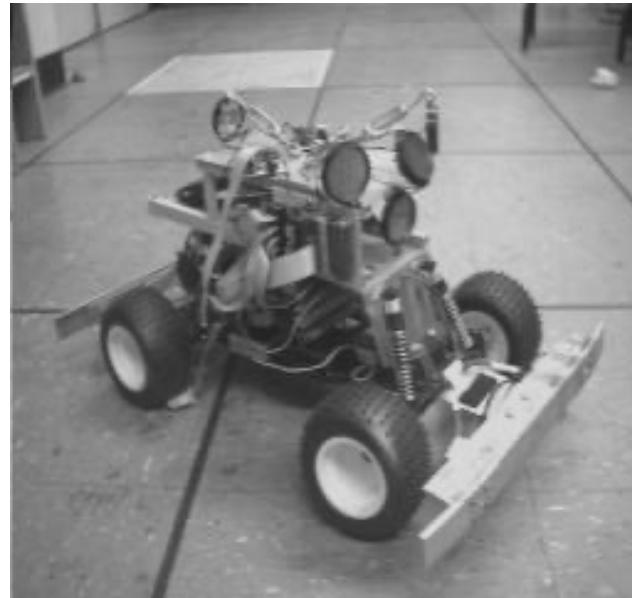

# Reinforcement Learning

---

## Example: Robots

- **input:** sensory information and reinforcement signal.
- **output:** avoid **negative** reward and try to have **positive** reward (obstacle avoidance, wall following, etc.)

---

# Important ML concepts that we'll use throughout the semester

Generalization, Overfitting, Cross Validation, etc

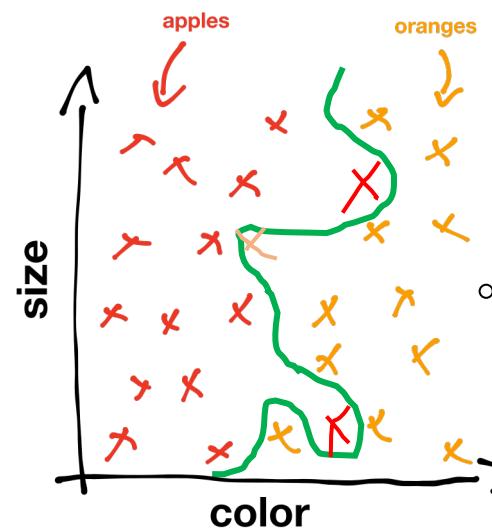

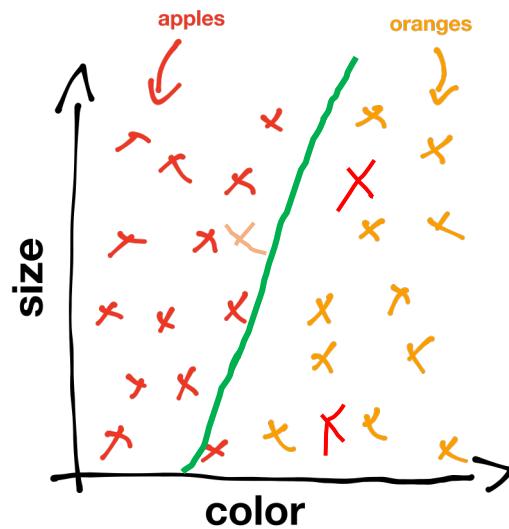

# Generalization

Will the classifier work for **unseen** fruits?

Is this an apple?

**The issue of generalization:** whether ML models are encouraged to learn generic patterns or simply remember details?

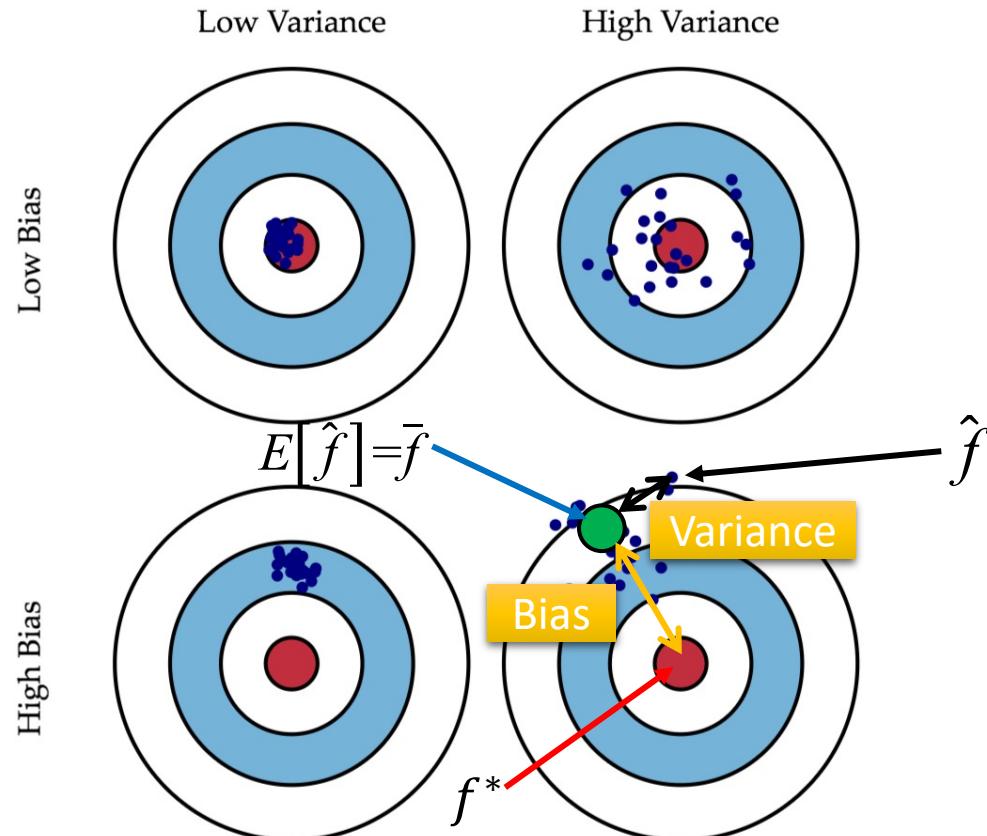

Which model is better?

# Bias and Variance

**Bias** – how close does the assumed model fit for the observed data?

**Variance** – how complex (e.g., freedom) the assumed model is?

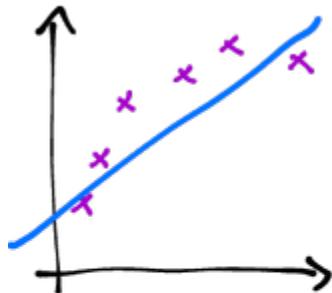

# The Bias-Variance Dilemma

Bias – how close does the assumed model fit for the observed data?

Variance – how complex (e.g., freedom) the assumed model is?

## Underfitting

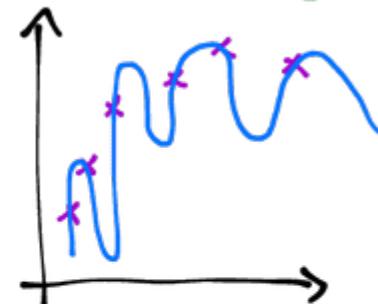

low complexity  
high bias  
low variance

## Complexity

## Overfitting

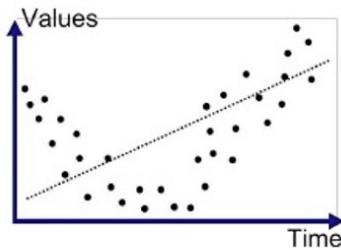

high complexity  
low bias  
high variance

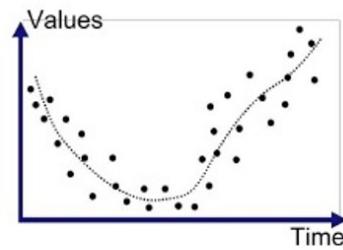

# Overfitting

**Underfitting** – the model isn't complex enough to capture the real knowledge, the assumption may not hold.

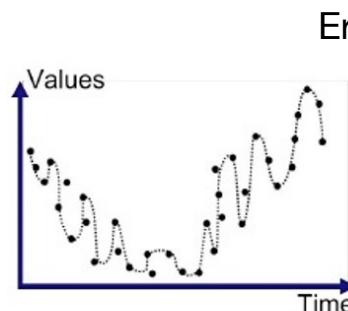

Underfitted

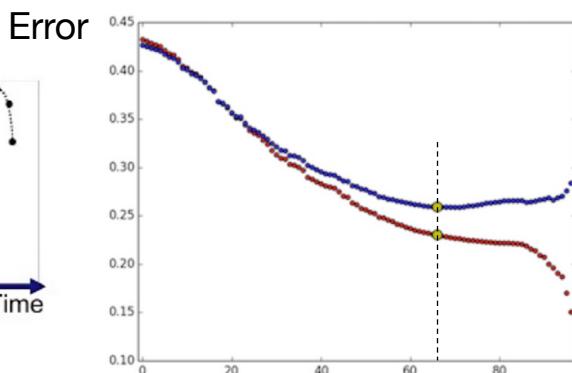

Good Fit/R robust

**Overfitting** – the model is too complex and thus describes the **details** of data (e.g., random noise) instead of underlying knowledge

Overfitted

Complexity

# Overfitting

## A real-world example (driving test)

1. 机动车遇到行人时应 A. 快速通过 B. 减速通过 C. 正常行驶
2. 在如图所示的场景中，驾驶员应 A. 停车等待 B. 减速让行 C.
3. 遇到下图所示的情况，下面哪个操作正确？ A.
4. ...

三短一长选最长

30

非正常行驶的场合，应选择谨慎的选项

90

- 题中有“应”字样的选B,
- 有“操作”字样的选C,
- 最长的题目选D,
- 看图题有女孩的选A, 没人的选C

100

# Prevent Overfitting

## Selecting models with appropriate complexity

### Widely used approaches (to mitigate overfitting)

- Increase training data
- Regularization (penalizing model complexity)
- Hold-out & cross validation (unseen data to ensure generalization)
- Early stopping
- Prior knowledge (e.g., Bayesian prior)
- ...

# Prevent Overfitting

Fit the **overall distribution** instead of the training set.

- To estimate the **generalization error**, we need data **unseen** during model training.
  - Data Splitting (Hold-Out):
    - ▷ Training set (e.g., 50%)
    - ▷ Validation set (e.g., 25%)
    - ▷ Test set (e.g., 25%)
- 平时练习

模拟考试

高考!

In general, design a **good loss function** to indicate the performance of the predictive model **over the whole-data distribution** instead of the training data can help achieve compromise between simplicity and complexity of the model structure.

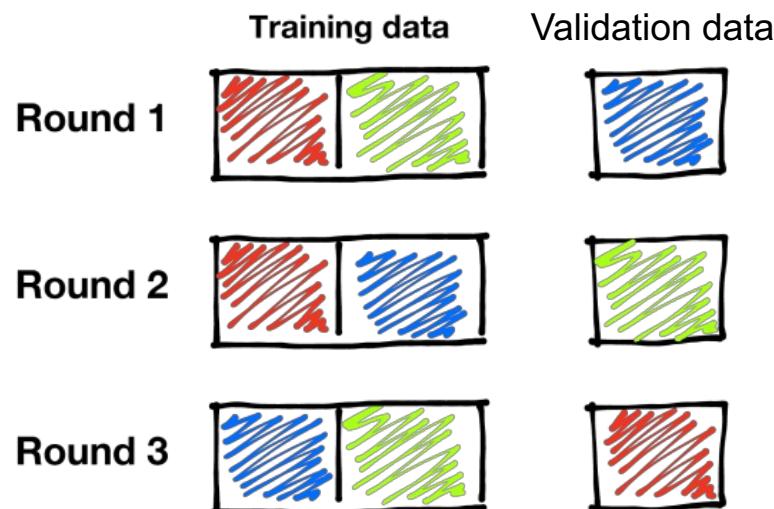

# Cross Validation

What if we want to make the most of the data?  
(e.g., when the dataset is **small**)

- K-folder CV

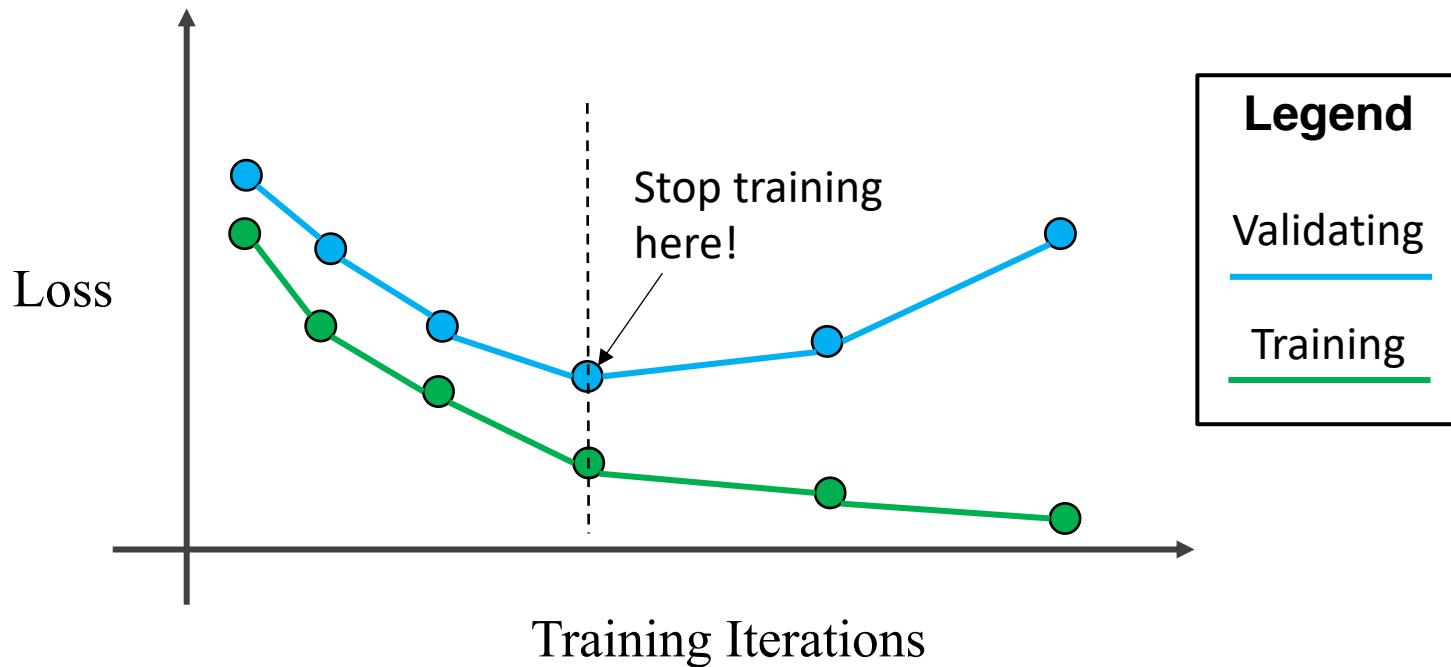

Original data, divided into k parts

- Allow for more train-test splits
- A better indication of how well your model performs on unseen data
- Takes more computational power and time

# Early Stop

- Stop training before we have a chance to overfit

# Regularization

- Add a **penalty term** of the parameters to prevent the model from overfitting the training data.

$$L(\mathbf{W}, \lambda_1, \lambda_2) = ||y - \mathbf{WX}||^2 + \lambda_2 ||w||_2^2 + \lambda_1 ||w||_1$$

Penalize model complexity in the loss function

# No free lunch theorem

---

- There is no universally best model.
- Different types of models have to be developed to suit the nature of the data in real applications.

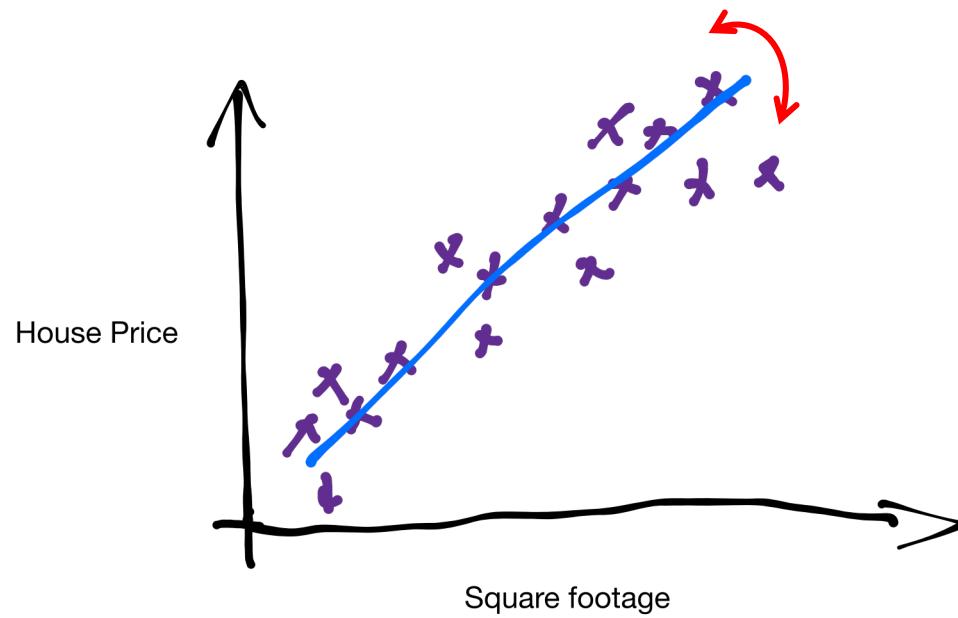

# What's Next

WHAT'S  
NEXT?

## Linear Regression:

- a simple and well-known machine learning algorithm.
- Similar to the least squares method (最小二乘法)

NEXT
